

RS232 interface-protocol PC ⇔ L-LAS-LT-...-MA Sensor - Firmware Version 3.14-TSD

- Standard RS232 serial interface, no hardware handshake
- 3-line connection: GND, TxD, RxD
- Speed: 19200 baud, 8 data-Bits, no parity-bit, 1 stop-bit, binary-mode

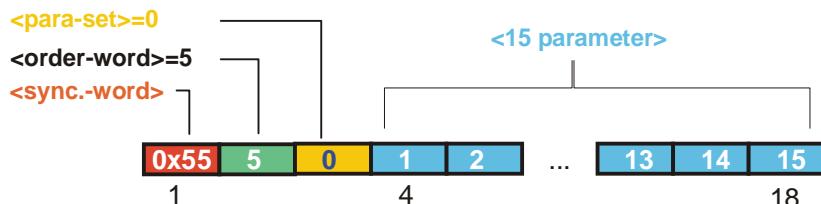

The control device (PC or PLC) must send a data frame consisting of *18-words* (*1 word = 2 byte = 16 bit*) to the *L-LAS-LT-...-MASTER control unit*. All words in the data frame must be transferred in binary format. The higher-order byte must be transferred first (MSB-first).

METHOD:

The microcontroller in the *L-LAS-LT-...-MASTER* sensor permanently reads the input buffer of its RS-232 module (polling). If the arriving word is *0x0055* (*0x55 hexadecimal = 85 decimal*), this is interpreted as a synchronisation event: (*<sync-word>*). The microcontroller then reads the order number (*<order-word>*) that is transferred with the 2nd word.

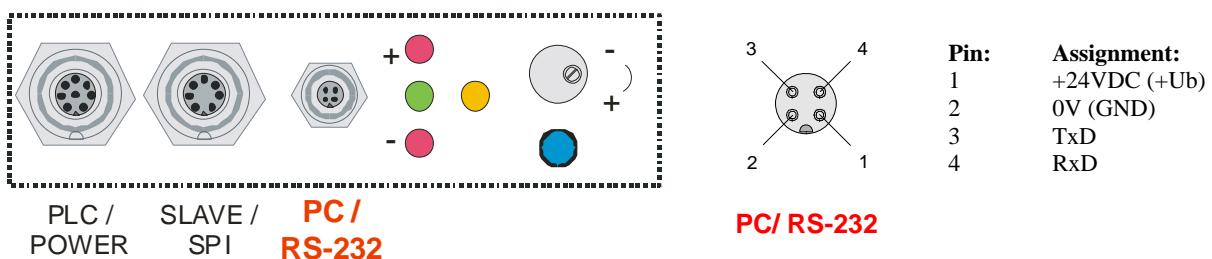

After the order word (*<order-word>*) another word is transferred that informs about the number of the parameter set (*<para-set>*). This is followed by additional 15 words *<parameter-word>* that contain the actual parameters. When the complete data frame (18 words = 36 bytes) has been read in, the *L-LAS-LT-...-MA* control unit starts to execute the order contained in the 2nd word (*<order-word>*).
