RS232 Interface-Protocol PC \leftrightarrow L-LAS-TB sensor

- Standard RS232 serial interface, no hardware handshake
- 3-wire connection: GND, TX0, RX0
- Speed: 19200 baud, 8 data-bits, no parity-bit, 1 stop-bit, binary-mode

The control device (PC or PLC) have to send a frame of **18-words** (**1 word = 2 byte = 16 bit**) to the *L-LAS-TB* hardware. All words must be transmitted in binary format. The most significant byte must be transmitted first (MSB-first).

METHOD:

The microcontroller of the L-LAS-TB sensor is permanently reading (polling) the input-buffer of the RS-232 module. If the incoming word = **0x0055** (0x55 hexadecimal = 85 decimal), this is interpreted as the synchronisation-event **<sync-word>**. After this, the 2.nd word with the order number **<order-word>** is read in by the microcontroller.

The order word **<order-word>**, is followed by 16 further words **<parameter-word>**.

After reading the complete data-frame (18-words = 36 bytes), the *L-LAS-TB* sensor hardware executes the order which is coded at the 2.nd word **<order-word>**.

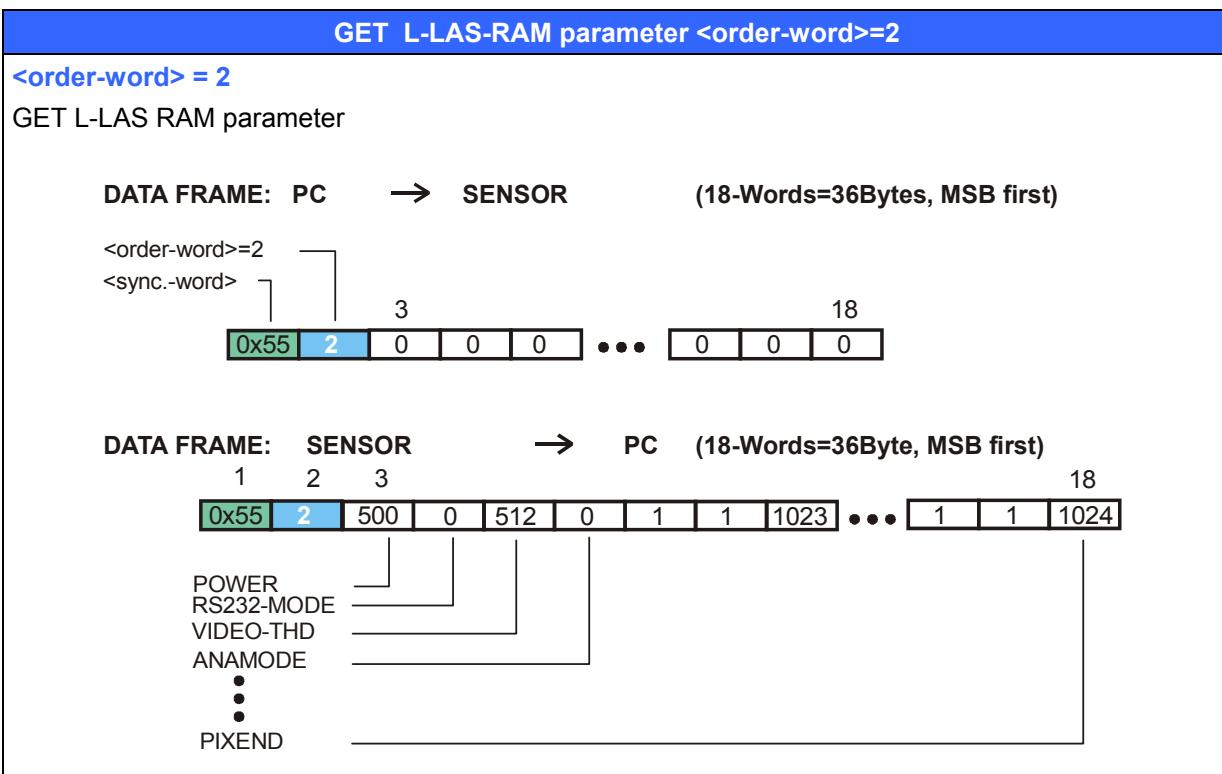

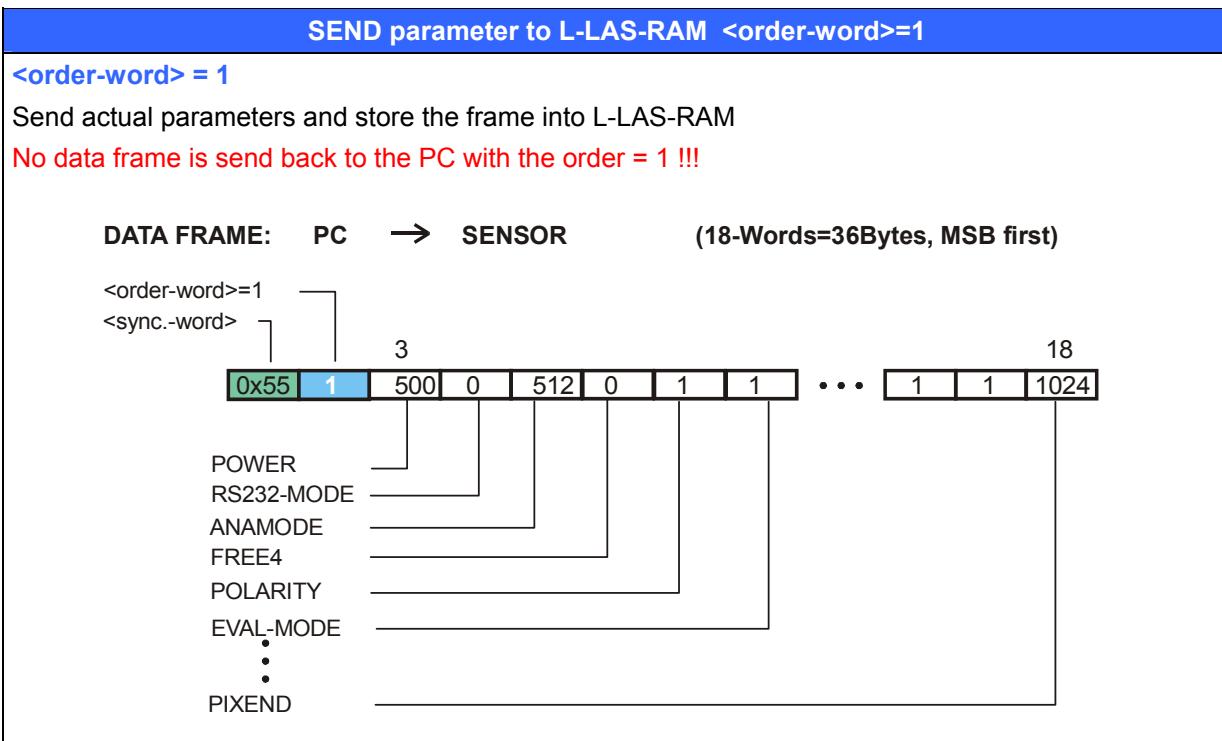

Format of the parameter-frame:

<p>DATA FRAME: PC \rightarrow SENSOR (18-Words=36Bytes, MSB first)</p> <pre> <order-word>=7 <sync.-word> 3 18 0x55 5 0 0 0 ... 0 0 0 </pre> <p>DATA FRAME: SENSOR \rightarrow PC (18-Words=36Byte, MSB first)</p> <pre> 1 2 3. 18 0x55 5 0xA 0 0 0 ... 0 0 0 ECHO=170 </pre>		

GET measured-values of L-LAS-sensor <order-word>=8

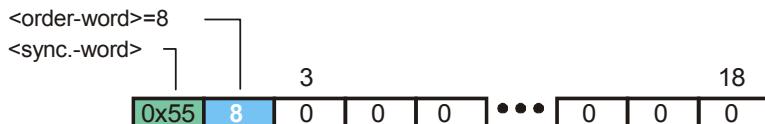

<order-word> = 8

The µController sends the actual measured values to the PC.

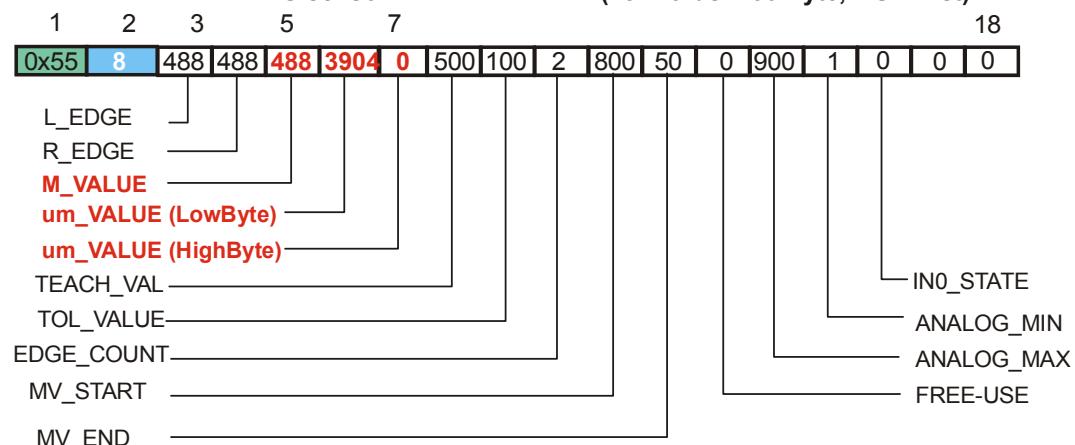

The 5. word of the data-frame represents the actual measured value: **M_VALUE**.

The 6 and 7th. word of the data-frame represents the measured value in micrometer: **um_VALUE**.

Due to limited RAM memory at the L-LAS-sensor, the data buffers have to be sent to the PC in blocks of 64-words one after the other. The data buffer contents the 256-pixel of the intensity-profile which is measured at the CCD-receiver.
